

Course Review of Feelings

3150102418 张倬豪

At first I heard from my senior fellows that the course “Introduction to the computer system” is a wonderful course to take because it can provide a brand new knowledge base and broaden my horizon in the computing world. So even if it is in the middle of the summer vacation, I signed up for it.

Indeed, I got inspired. From the basic gates to a real but simple (of course it's not simple for us) computer LC-3, from logic language to assembly language to a higher one, C, this course constructed a new world for me. Before this course, computer is so mysterious for me even if I major in computer science. All I know is write a little C in a compiler, without knowing anything how the computer actually works.

Now I do, in a superficial way, though. But at least computer is no longer unknown to me. Thanks to Professor Patt and all the teaching assistants that teach and work in such a hot weather that does not suit for people to have activities.

Yes, I have to say this course is much more difficult than the courses that I took last year in ZheJiang University, the homework and assignments were appearing one by one, but actually only in this way can we achieve something real rather than taking a course that gives scores casually with no homework. So I hold my gratitude for the opportunity to have the course.

Finally, I hope I can have more chances to contact those professors that are really excellent both in academy and personality. Professor Patt is an interesting teacher,

it' s a pleasure to have his class.
